Abstract: At the July 2002 SSGRR international conference in LAquila, Italy, three needs emerged as particularly pressing in educational technology at institutions of learning worldwide. These included the need for: 1) more innovative design in the integration of technology into the curriculum; 2) more emphasis on learning strategies and less on both teaching methods and instructional software; and 3) more concentrated attention on issues of technological equitability. This presentation demonstrates how a handheld PRS device (the EduCue) can help fill these needs and makes a case for a more comprehensive tapping of its proven potential for enhancing student learning.
